

- Why do French citizens feel the most threatened, given they are not the most at risk?

France by Demographic information

How agree or disagree with the statement: "My country is threatened."

COUNTRY is threatened.

- A. Strongly agree
- Somewhat agree
- Somewhat disagree
- Strongly disagree
- Don't know

- Demographic information on respondents age, gender, and region.

Why France?

- Why do French citizens feel the most threatened, given they are not the most at risk?

Results

- Perceptions of national threat level in France are remarkably stable across gender, age, and region. In fact, only the island of Corsica shows a significant difference, with the proportion of respondents who agree at a much lower level. This begs the question, are feelings of national insecurity a mainland France phenomenon?

Conclusion

- As shown by the data, Europeans across nationalities and across demographics agree that the security of their nation is under threat.

- However, countries that border hostile countries do not show the highest level of alarm. Rising insecurity among Europeans has less to do with the actual level of threat a nation faces.

- There is little disparity between demographics in France, leading me to believe that the level of threat felt, at least in France, probably does not align with political affiliation, and is a country-wide phenomenon.

- Future researchers should examine what cultural and political conditions cause citizens of a country to feel as though their national security is threatened, regardless of the actual threat level.
